LocalSolver

Major novelties released in 6.0 version

www.localsolver.com

Who we are

Bouygues, one of the French largest corporation, €33 bn in revenues
http://www.bouygues.com

Operations Research subsidiary of Bouygues
20 years of practice and research
http://www.innovation24.fr

Mathematical optimization solver commercialized by Innovation 24
http://www.localsolver.com

LocalSolver

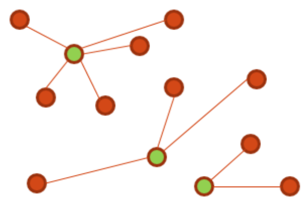
Hybrid math optimization solver

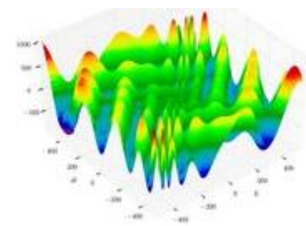
For combinatorial, numerical,
or mixed-variable optimization

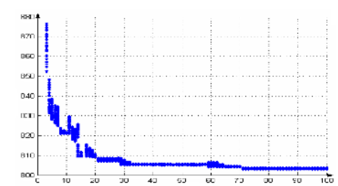
Suited for large-scale
non-convex optimization

Quality solutions in seconds
without tuning

LocalSolver
=
LS + CP/SAT + LP/MIP + NLP







free trial with support – free for academics – renting licenses from 590 €/month – perpetual licenses from 9,900 €

Set-based modeling

Innovative modeling concepts
for routing & scheduling problems

Set-based modeling

Structured decisional operator list(n)

- Order a subset of values in domain {0, ..., n-1}
- Each value is unique in the list

Classical operators to interact with "list"

- count(u): number of values selected in the list
- at(u,i) or u[i]: value at index i in the list
- indexOf(u,v): index of value v in the list
- contains(u,v): equivalent to "indexOf(u,v) != -1"
- disjoint(u1, u2, ..., uk): true if u1, u2, ..., uk are pairwise disjoint
- partition(u1, u2, ..., uk): true if u1, u2, ..., uk induce a partition of {0, ..., n-1}

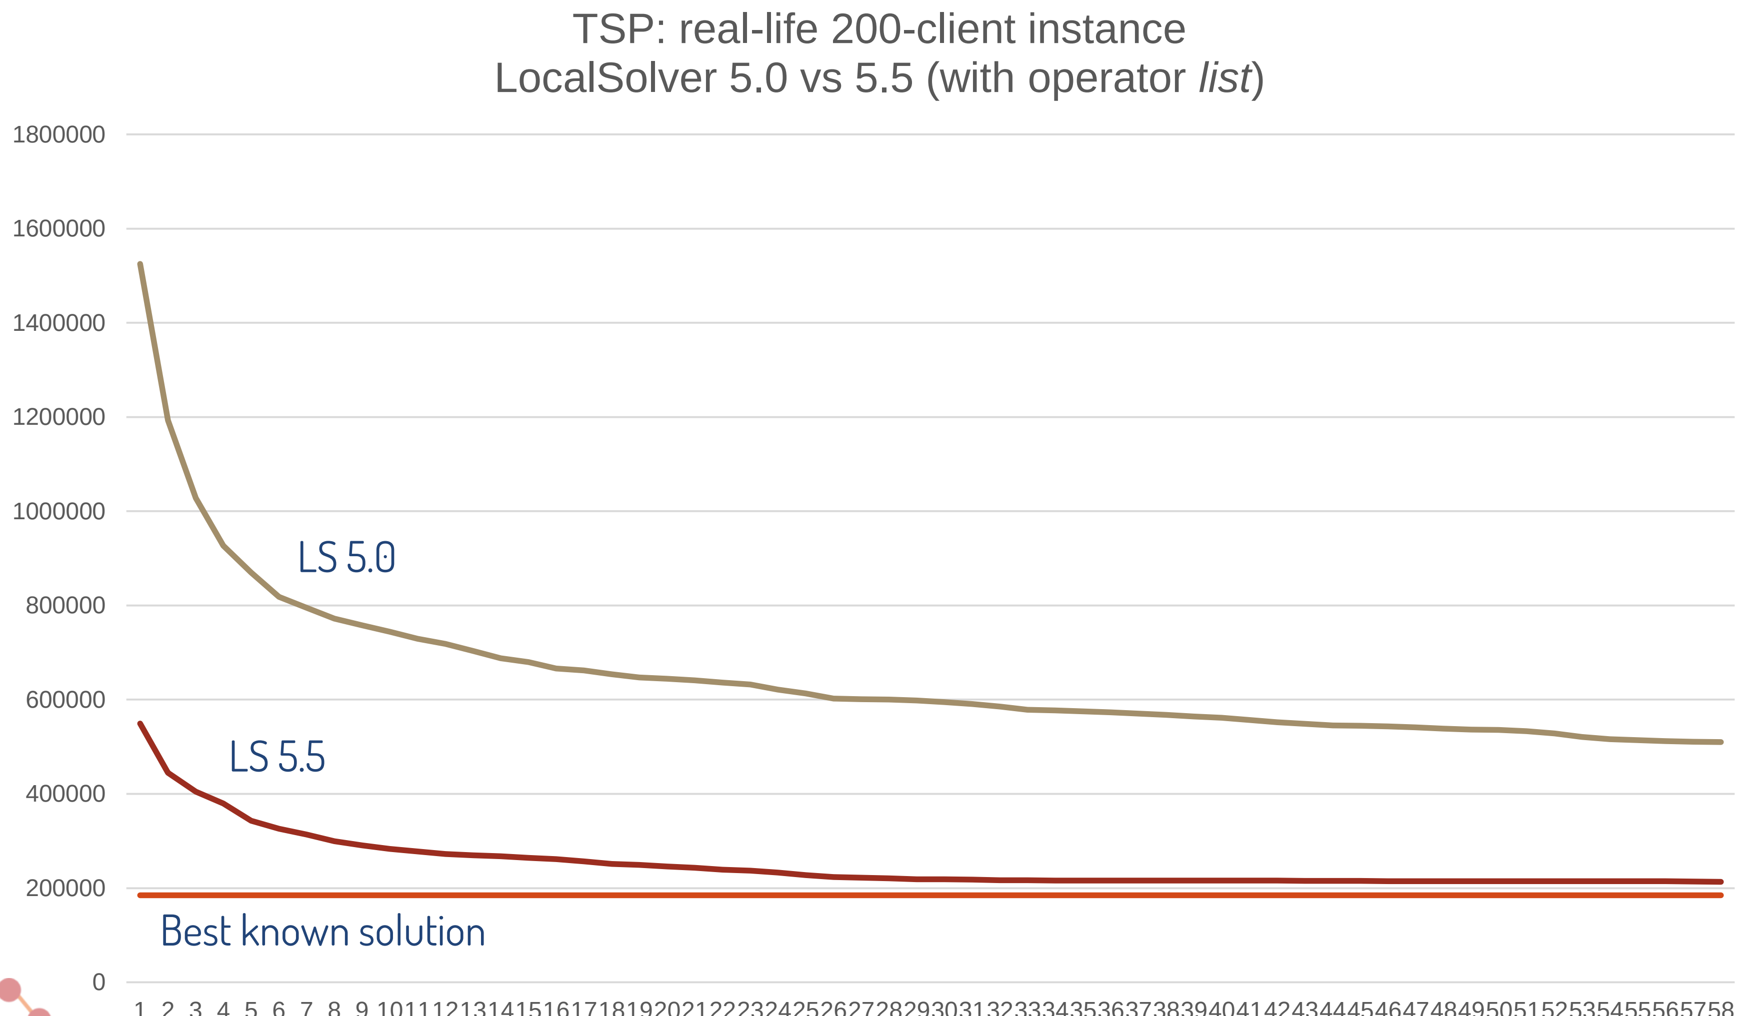
Traveling salesman

```
function model() {
  x <- list(N) ; // order n cities {0, ..., n-1} to visit
  constraint count(x) == N; // exactly n cities to visit
  minimize sum[i in 1..N-1]( Dist[ x[i-1] ][ x[i] ] )
                         + Dist[ x[N-1] ][ x[0] ] ; // minimize sum of traveled distances
}
```

Could you imagine simpler model?

- Natural declarative model: straightforward to understand
- Common set-oriented concepts: easy to learn
- Still easier for people with (basic) programming skills
- Compact: linear in the size of input → highly scalable (1 million nodes)

Traveling salesman



Vehicle routing

```
function model() {
  x[1..K] <- list(N) ; // for each truck, order the clients to visit
  constraint partition( x[1..K] ); // each client is visited once
  distances[k in 1..K] <- sum[i in 1..N-1]( dist( x[k][i-1], x[k][i]) )
            + dist( x[k][N-1], x[k][0] ); // traveled distance for each truck

  minimize sum[k in 1..K]( distances[k] ); // minimize total traveled distance
}
```

To go further, to make it simpler

- Sets (unordered) versus lists (ordered)
- Multi-sets/lists: multiple occurrence of the same values
- Collections of objects instead of values
- Ability to iterate and project over collections (lambda expressions)

CVRP benchmarks

CVRP - instances A

- 32 to 80 clients, 10 trucks max.
- 27 instances
- 5 minutes of running time
- LS binary: almost infeasible
- LS list: 1 % avg. opt. gap

CVRP - instances X100-500

- 100 to 500 clients, 138 trucks max.
- 67 instances
- 5 minutes of running time
- LS binary: almost infeasible
- LS list: 9 % avg. opt. gap

CVRPTW benchmarks

CVRPTW – instances Solomon R100

- 101 to 112 clients, 19 trucks max.
- 13 instances
- 5 minutes of running time
- LS binary: N/A
- LS list: 3 % avg. opt. gap

CVRPTW – instances Solomon R200

- 201 to 208 clients, 4 trucks max.
- 8 instances
- 5 minutes of running time
- LS binary: N/A
- LS list: 8 % avg. opt. gap

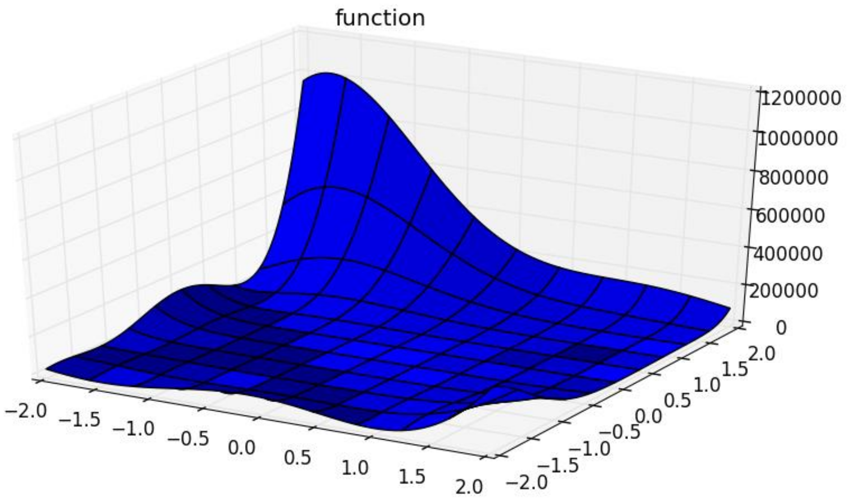
Black-box optimization

Plug LocalSolver to numerical
or discrete-event simulators

Black-box optimization

Context

- Unknown objective (oracle)
- Costly to evaluate
- Derivative-free
- Continuous & integer decisions
- Bounds on decisions



Many applications in engineering

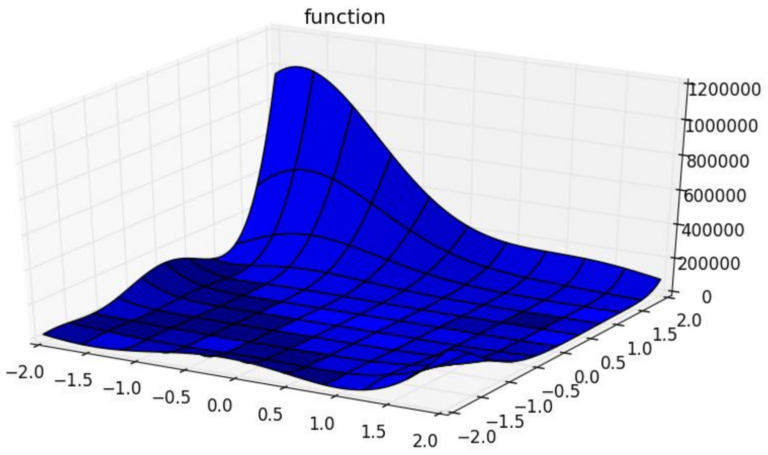
- Multidisciplinary/parametric optimization
- Simulation optimization (noisy, nondeterministic)

→ Design optimization of materials/systems: mechanics, electricity, logistics, etc.

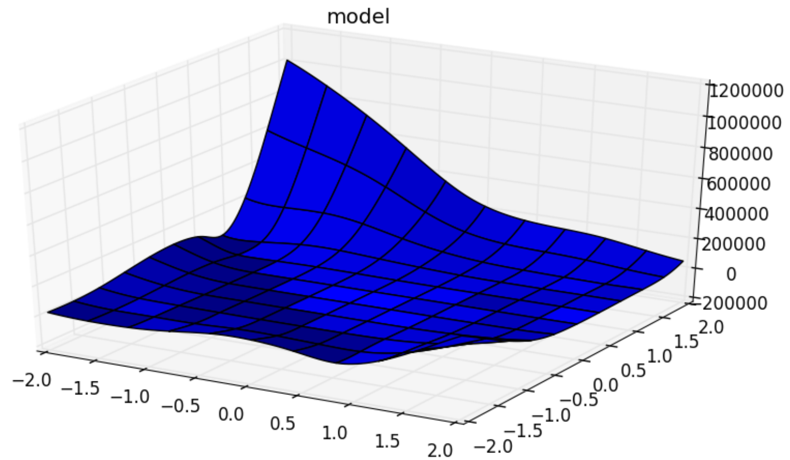
Learning

Learn the objective function landscape

- Objective landscape modeled by Radial Basis Functions
- Several models are built with different techniques/parameters
- Automatic selection of the most promising models for optimization



Objective Function



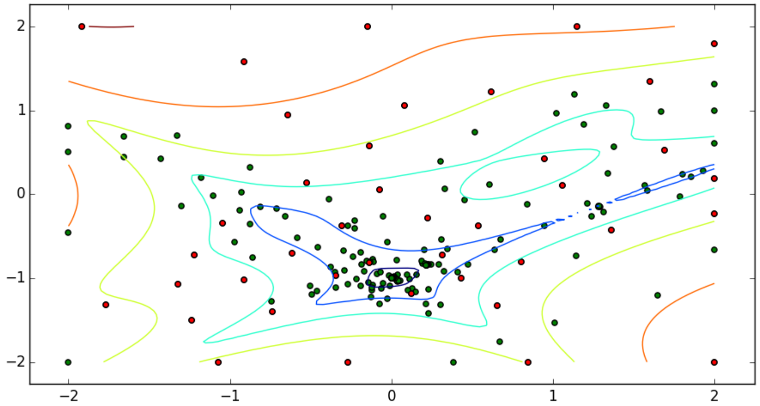
Objective Model

Optimization

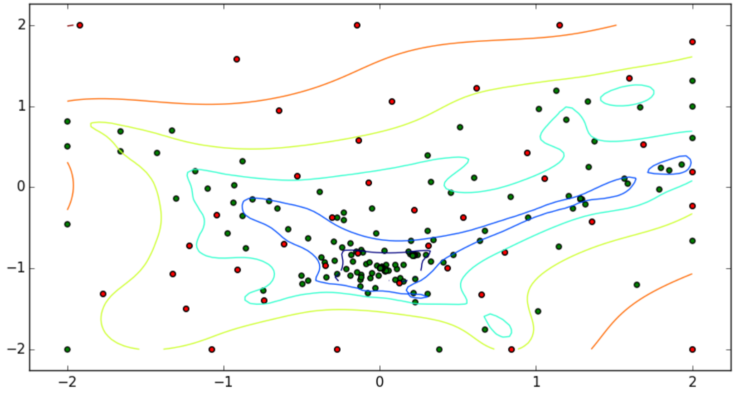
Exploitation & diversification

- Exploitation: optimize over the objective model
- Diversification: explore new promising regions

→ NLP subproblems solved through LocalSolver techniques:
local & direct search, gradient-based line search, etc.



Objective Function



Objective Model

Benchmark

Instances

- 25 instances from the recent paper by Costa and Nannicini.

  RBFOpt: an open-source library for black-box optimization with costly function evaluations. Optimization Online. (under review)

- 20 runs per instance, 150 calls max. to the black-box per run
- Numerical precision: 1e-6

Preliminary results

- RBFOpt: 345 opt. solutions found, 82 calls avg. per run
- LocalSolver: 310 opt. solutions found, 94 calls avg. per run
- NOMAD (GERAD): 170 opt. solutions found

Roadmap

John N. Hooker (2007)

"Good and Bad Futures for Constraint Programming (and Operations Research)"
Constraint Programming Letters 1, pp. 21-32

"Since modeling is the master and computation the servant, no computational method should presume to have its own solver.

This means there should be no CP solvers, no MIP solvers, and no SAT solvers. All of these techniques should be available in a single system to solve the model at hand.

They should seamlessly combine to exploit problem structure. Exact methods should evolve gracefully into inexact and heuristic methods as the problem scales up."
